

WHITMORE, Harold James

DOB: March 8, 1945 | Age: 74 yrs | Sex: Male | MRN: SMC-04471932

Encounter Date: March 8, 2019 | Provider: Peter Grant, MD — Radiology | Doc ID: LIV-2019-0308-PET

Nuclear Medicine / PET Report

PSMA PET/CT and Multiparametric Prostate MRI (Order of 02/14/2019)**Examinations**

Study 1	Ga-68 PSMA PET/CT, skull base to mid-thigh
Study 2	Multiparametric prostate MRI with/without contrast
Indication	Rising PSA (1.4 ng/mL) post-radiotherapy; evaluate for recurrence
Comparison	Staging MRI 09/2013

PSMA PET/CT Findings

No abnormal PSMA-avid focus within the prostate bed. No PSMA-avid pelvic or retroperitoneal lymphadenopathy. No osseous or visceral PSMA-avid metastatic disease. Physiologic tracer distribution otherwise. Incidental note of coronary and aortic vascular calcification and mild emphysematous changes at lung bases.

Prostate MRI Findings

Post-radiation changes with diffusely low T2 signal and gland atrophy (expected). No discrete focus of restricted diffusion to suggest local recurrence. Seminal vesicles unremarkable. No suspicious pelvic nodes.

Impression

1. No imaging evidence of local recurrence or metastatic prostate cancer despite PSA rise to 1.4 ng/mL. Findings most consistent with benign post-radiation changes / PSA fluctuation.
 2. Incidental basal emphysema — correlate with pulmonary evaluation.
- Recommend continued PSA surveillance.
