

WHITMORE, Harold James

DOB: March 8, 1945 | Age: 68 yrs | Sex: Male | MRN: SMC-04471932

Encounter Date: January 17, 2014 | Provider: Anita Desai, MD — Radiation Oncology | Doc ID: NCI-2014-0117-RTSUM

Radiation Oncology — End-of-Treatment Summary

Completion of Definitive Prostate IMRT

Treatment Summary

Technique	Intensity-modulated radiotherapy (IMRT), image-guided (daily CBCT)
Target	Prostate + proximal seminal vesicles + planning margin
Total Dose	78 Gy in 39 fractions (2.0 Gy/fraction)
Treatment Dates	November 18, 2013 — January 15, 2014
Concurrent ADT	Leuprolide depot (ongoing, 18-month course)

Course & Toxicity

Patient completed all 39 fractions without interruption. Acute toxicity: Grade 1 urinary frequency and Grade 1 proctitis/loose stools, managed with tamsulosin and dietary measures; Grade 1 fatigue. No Grade ≥2 toxicity. Weight stable. Glucose monitored — mild rise in fasting glucose attributed to ADT, communicated to endocrinology.

On-Treatment Labs

Testosterone 01/10/2014: 12 ng/dL (castrate level, <20 confirms effective ADT). PSA not routinely measured during RT.

Assessment & Surveillance Plan

Definitive radiotherapy completed for intermediate-risk localized prostate cancer. Continue leuprolide through approximately mid-2015 (18 months total). PSA surveillance every 3-6 months. Expect PSA nadir over 12-24 months. Monitor bone density, glycemia, and cardiovascular risk on ADT. Next PSA and testosterone in 3 months.
